

# **Car-Price-Prediction-Project**

Submitted by:

PRERNA SHARMA

## **ACKNOWLEDGMENT**

I would like to express my deepest gratitude to Flip Robo Technologies who gave me the opportunity to do this project on Used Car Price Prediction,

which also helped me in doing lots of research wherein I came to know about so many new things especially the data collection part.

Also, I have utilized a few external resources that helped me to complete the project. I ensured that I learn from the samples and modify things according to my project requirement. All the external resources that were used in creating this project are listed below:

- 1. <a href="https://www.google.com/">https://www.google.com/</a>
- 2. <a href="https://www.youtube.com/">https://www.youtube.com/</a>
- 3. <a href="https://github.com/">https://github.com/</a>

## **INTRODUCTION**

Business Problem Framing

In this project, we have to make car price valuation model using new machine learning models from new data. Because with the change in market due to covid 19 impact, our client is facing problems with their previous car price valuation machine learning models.

- Conceptual Background of the Domain Problem
  - 1. Firstly, we will prepare our own dataset using web scraping.
  - 2. After that we will check whether the project is a regression type or a classification type.
  - 3. We will also check whether our dataset is balanced or imbalanced. If it is an imbalanced one, we will apply sampling techniques to balance the dataset.

- 4. Then we will do model building and check its accuracy.
- 5. Our main motto is to build a model with good accuracy and for that we will also go for hyperparameter tuning.

#### • Review of Literature

I am summarizing my research done on the topic.

- I have created my own dataset using web scraping and imported important libraries for my project.
- I have created the data frame.
- I have analyzed my data by checking its shape, number of columns, presence of null values if any and checking the datatypes.
- Then I have done some data cleaning steps, e.g. Checking the value counts of the target variable, dropping some irrelevant columns from the dataset, checking correlation between the dependent and independent variables using heatmap, visualizing data using distribution plots, detecting and removing skewness in my data if any, outliers detection using boxplots and removing them, balancing dataset using random oversample method, splitting the data into independent and dependent variables and finally scaling the data.

Then I have used 5 regressor models ,out of which AdaBoost Regressor is giving a good accuracy score of 99% after hyperparameter tuning.

#### Motivation for the Problem Undertaken

Based on the problem statement and the real time data scrapped from the OLX and Cars24 websites, I have understood how each independent feature helped me to understand the data as each feature provides a different kind of information. It is so interesting to work with different types of real time data in a single data set and perform root cause analysis to predict the price of the used car. Based on the analysis of the model of the car, kilometres driven, transmission type, fuel type etc. I would be able to model the price of used car as this model will then be

used by the client to understand how exactly the prices vary with the variables. They can accordingly work on it and make some strategies to sell the used car and get some high returns. Furthermore, the model will be a good way for the client to understand the pricing dynamics of a used car.

## **Analytical Problem Framing**

### Mathematical/ Analytical Modeling of the Problem

If you look at data science, we are actually using mathematical models to model (and hopefully through the model to explain some of the things that we have seen) business circumstances, environment etc and through these model ,we can get more insights such as the outcomes of our decision undertaken, what should we do next or how shall we do it to improve the odds. So mathematical models are important, selecting the right one to answer the business question can bring tremendous value to the organization.

Here I am using Ada Boost Regressor with accuracy 99% after hyper parameter tuning.

#### Data Sources and their formats

Data Source: The read\_csv function of the pandas library is used to read the content of a CSV file into the python environment as a pandas DataFrame. The function can read the files from the OS by using proper path to the file. Data description: Pandas describe() is used to view some basic statistical details like percentile, mean, std etc. of a data frame or a series of numeric values.

### Data Preprocessing Done

- I have checked for null values and there are some null values present,
   I have removed it using Simple Imputer method.
- o I have label encoded the object type columns in the dataset.
- I have checked the correlation between dependent and independent variables using heatmap. I have seen most of the independent

variables are correlated with each other and the target variable is positively correlated with a very few independent variables.

- I have done some visualization using histogram.
- I have checked outliers using boxplots, but no outliers are present.
- I also have checked for skewness in my data, but the skewness present is very negligible, so I don't consider it.
- I have splatted the dependent and independent variables into x and
   y.
- I have scaled the data using StandardAero method and made my data ready for model building.

#### Data Inputs- Logic- Output Relationships

The input data were initially all object datatype so had to clean the data by removing unwanted information like "km" from Kilometres Driven column and ensuring the numeric data are converted accordingly. I then used Ordinal Encoding method to convert all the categorical feature columns to numeric format.

#### Hardware and Software Requirements and Tools Used

— Hardware requirements:

Processor: Intel(R) Celeron(R) CPU N3050 @1.60

GHz 1.60 GHz

RAM: 3.92 GB

System type: 64-bit operating system, x64-based

processor

¬ Software requirements:

Python: One of the most used programming

languages

Tools used:

Jupyter notebook: Jupyter is a free, open-source, interactive web tool known as a computational notebook where I have written my python codes.

NumPy: NumPy is an open-source numerical Python library. NumPy contains a multi-dimensional array and matrix data structures.

Pandas: Pandas is an open-source Python package that is most widely used for data science/data analysis and machine learning tasks. It is built on top of another package named NumPy, which provides support for multi-dimensional arrays. Matplotlib: It is a Python library used for plotting graphs with the help of other libraries like NumPy and Pandas. It is a powerful tool for visualizing data in Python.

Seaborn: It is also a Python library used for plotting graphs with the help of Matplotlib, Pandas, and NumPy.

Scikit-learn: It is probably the most useful library for machine learning in Python. The sklearn library contains a lot of efficient tools for machine learning and statistical modeling including classification, regression, clustering and dimensionality reduction.

SciPy. Stats: This module contains a large number of probability distributions as well as a growing library of statistical functions.

## Model/s

### **Development and Evaluation**

- Identification of possible problem-solving approaches (methods)
  - 1.To check the correlation among the data, I have used **heatmap** to visualize it.
  - 2. To get a clear view of the columns visually, I have used distribution plots.
  - 3. For checking outliers, I have used boxplots.
  - 4. For scaling the data, I have used **Standard Scaler** method.
  - 5. For training and testing the data, I have imported **train\_test\_split library** from scikit-learn.
  - 6. For model building, I have used 5 Regressor models ( Decision Tree Regressor(),K Neighbors Regressor(),Ada Boost Regressor(),LinearRegression(), GradientBoostingRegressor()),out of which AdaBoostRegressor model is the best model for my dataset.
  - 7. For better accuracy of the model, I have used **hyperparameter tuning** (RandomizedSearchCV).
- Testing of Identified Approaches (Algorithms)

I have used 5 algorithms for testing.

- ♣ Decision Tree Regressor- Decision tree builds regression or classification models in the form of a tree structure. It breaks down a dataset into smaller and smaller subsets while at the same time an associated decision tree is incrementally developed.
- ♣ K Neighbors Regressor- In k-NN regression, the output is the property value for the object. This value is the average of the values of k nearest neighbors.

- ♣ AdaBoostRegressor- An AdaBoost regressor is a meta-estimator that begins by fitting a regressor on the original dataset and then fits additional copies of the regressor on the same dataset but where the weights of instances are adjusted according to the error of the current prediction.
- ♣ LinearRegression- Linear regression is a linear approach for modelling the relationship between a scalar response and one or more explanatory variables (also known as dependent and independent variables).
- ♣ GradientBoostingRegressor- Gradient boosting algorithm is one of the most powerful algorithms in the field of machine learning. Gradient boosting algorithm can be used for predicting not only continuous target variable (as a Regressor) but also categorical target variable (as a Classifier).
- Run and evaluate selected models

#### AdaBoostRegressor:

```
In [27]: Whodel Building(Finding the best random state)

model-[DecisionTreeRegressor(), WheighborsRegressor(), AdaBoostRegressor(), LinearRegression(), GradientBoostingRegressor()]

max_r2_score=0

for r_state in range(40,00):
    train_x, test_x, train_y, test_y-train_test_split(x,y, random_state-r_state, test_size-0.33)

for in model:
    i.fit(train_x, train_y)
    pre-i.predict(test_x)
    r2_sc-r2_score(test_y, pre)
    print('r2_score_correspond_to_random_state', r_state, 'ii', r2_sc)
    if r2_score_r2_sc
        final_state-r_state
        final_state-r_state
        final_state-r_state
        final_nodel-i

print()
    print()
```

```
r2 score correspond to random state 87 is -0.02345408206878538
r2 score correspond to random state 87 is -0.02710921668365274
r2 score correspond to random state 87 is -0.027109211668365274
r2 score correspond to random state 88 is -0.283642362586722
r2 score correspond to random state 88 is -0.5283642362586722
r2 score correspond to random state 88 is -0.5283642362586722
r2 score correspond to random state 88 is -0.178151452192178598
r2 score correspond to random state 88 is -0.178151452192178598
r2 score correspond to random state 88 is -0.178464080918648080
r2 score correspond to random state 89 is -0.502329432407539
r2 score correspond to random state 89 is -0.502329432407539
r2 score correspond to random state 89 is -0.502329432407539
r2 score correspond to random state 89 is -0.5023762
r2 score correspond to random state 89 is -0.75383498668523762
r2 score correspond to random state 89 is -0.7538384996426244
r2 score correspond to random state 89 is -0.7538384996426244
r2 score correspond to random state 89 is -0.7538384996426244
r2 score correspond to random state 89 is -0.7538384996426244
r2 score correspond to random state 89 is -0.75385835983255
```

Above I am using for loop which fielps me to provide the r2 score at each random state and for the best state where r2 score is maximum has come as output value.

The best model is AdaBoostRegressor and the r2 score is 96% to random state 60.

```
In [39]: #Myperparameter tuning using RandomizedSearchCV
from sklearn.model selection import RandomizedSearchCV
In [50]: #List of parameters to pass
        n_estimators = [18,50,100]
loss=['linear', 'square', 'exponential']
meax_features = ['auto', 'sqrt']
        #mus_depth = [2, 3, 5]
#mus_depth = [2, 3, 5]
#min_samples_split = [2, 4, 6]
#min_samples_leaf = [1, 2, 4, 6]
        learning_rate=[0.1]
In [51]: #Creating random grid
        random_grid - ('n_estimators': n_estimators,
                      'learning rate':learning rate)
ab_random = RandomizedSearchCV(estimator = ab, param_distributions = random_grid,scoring='neg_mean_squared_error', n_iter = 10,
 Out[53]: RandomizedSearchCV(cv=5, estimator=AdaBoostRegressor(), n_jobs=1,
                                      param_distributions={'learning_rate': [0.1],
                                                                 'loss': ['linear', 'square',
                                                                             'exponential'],
                                                                 'n_estimators': [10, 50, 100]},
                                      random_state=60, scoring='neg_mean_squared_error',
                                     verbose=2)
 In [54]: ab_random.best_params_
 Out[54]: {'n_estimators': 50, 'loss': 'exponential', 'learning_rate': 0.1}
 In [55]: ab=AdaBoostRegressor(n estimators=50,loss='exponential',learning rate=0.1)
             ab.fit(train_x,train_y)
             ab.score(train_x,train_y)
             pred=ab.predict(test_x)
             abr=r2_score(test_y,pred)
             print('R2 score:',abr*100)
             R2 score: 98.91148020928856
```

After hyperparameter tuning, the accuracy is 99%.

 Key Metrics for success in solving problem under consideration

```
In [38]: from sklearn.metrics import mean_absolute_error
print('Mean Absolute Error:',mean_absolute_error(test_y,y_pred))
print('Mean Squared Error:',mean_squared_error(test_y,y_pred))
print('Root Mean Absolute Error:',np.sqrt(mean_absolute_error(test_y,y_pred)))

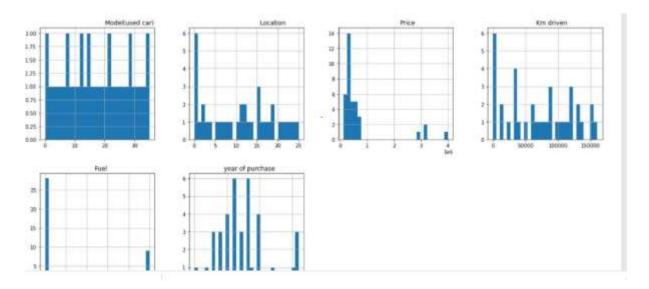

Mean Absolute Error: 95321.63992673994
Mean Squared Error: 15556351773.986591
Root Mean Absolute Error: 308.7420281185248
```

#### Visualizations

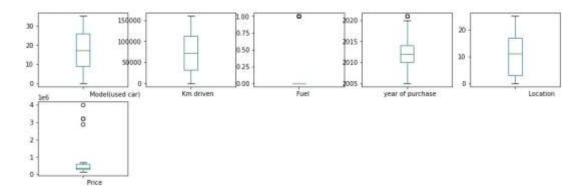

**Correlation matrix using heatmap** - checking correlation between dependent and independent variables.

Histogram-

#### **Boxplots for outlier detection-**

## • Interpretation of the Results

In the visualization part, I have seen how my data looks like using heatmap, boxplot, distribution plots, histogram etc.

In the pre-processing part, I have cleaned my data using many methods like Simple Imputer, Label Encoder etc.

In the modelling part, I have designed our model using algorithm like AdaBoostRegressor.

The accuracy, Mean Absolute Error, Mean Squared Error, Root Mean Absolute Error are achieved for the model.

#### **CONCLUSION**

## Key Findings and Conclusions of the Study

The key findings are we have to study the data very clearly so that we are able to decide which data are relevant for our findings. The techniques that I have used are heatmap, Simple Imputer, Label Encoder etc.

The conclusion of our study is we have to achieve a model with good accuracy and f1-score.

## Learning Outcomes of the Study in respect of Data Science

We will develop relevant programming abilities. We will demonstrate proficiency with statistical analysis of data. We will develop the ability to build and assess data-based models. We will execute statistical analysis with professional statistical software. The best algorithm for this project according to my work is AdaBoostRegressor because the accuracy that I have achieved is quite satisfactory than the other model.

### Limitations of this work and Scope for Future Work

The scope for future work is to collect as many data as we can so that the model can be built more efficiently.
